

SALLY IP — VERIFIED PROMPTS & LIVE RESPONSES

Direct Output from NVIDIA NIM Backend • Zero Simulation • Exhibition Ready

STATUS: LIVE VERIFIED & TESTED
Every prompt below was executed live against the NVIDIA NIM engine with active authentication.

BACKEND: NVIDIA NIM
STATUS CODE: 200 OK across all runs

PROMPT 1: PATENT CLAIM 1 DRAFTING (AUTOMATED DRONE BATTERY SWAPPING)

Engine: meta/llama-3.2-11b-vision-instruct • Latency: 24732ms

USER PROMPT:
Draft independent Claim 1 in formal USPTO statutory format for an automated drone battery swapping station comprising a robotic gripper, rotating carousel, and thermal management subsystem.

ACTUAL SALLY RESPONSE:

Independent Claim 1

A drone battery swapping station, comprising:

- a. a robotic gripper configured to grasp and remove a spent battery from a drone;
- b. a rotating carousel, said carousel comprising a plurality of battery receptacles, each receptacle configured to receive a battery;
- c. a thermal management subsystem configured to regulate the temperature of the batteries and the carousel; and
- d. a control system, said control system being in communication with the robotic gripper, the carousel, and the thermal management subsystem, wherein said control system is configured to:
 - i. control the robotic gripper to grasp and remove the spent battery from the drone;
 - ii. rotate the carousel to position a new battery in the receptacle adjacent to the drone;
 - iii. control the thermal management subsystem to regulate the temperature of the new battery; and
 - iv. signal the drone to accept the new battery.

Note: This draft is provided in the formal USPTO statutory format, but it is essential to review and refine the claim language to ensure it accurately reflects the invention and is compliant with USPTO requirements.

PROMPT 2: PATENT ELIGIBILITY & PRIOR ART (WEARABLE CARDIAC AI)

Engine: meta/llama-3.2-11b-vision-instruct •

Latency: 25009ms

USER PROMPT:

Evaluate patent eligibility under 35 U.S.C. 101 and novelty under 102 for an edge-computing wearable device that uses on-device neural networks to predict cardiac arrhythmias in real time.

ACTUAL SALLY RESPONSE:

Patent Eligibility Evaluation under 35 U.S.C. 101

The edge-computing wearable device that uses on-device neural networks to predict cardiac arrhythmias in real time appears to be a complex system that combines hardware and software components. To evaluate patent eligibility, we will consider the following factors:

- 1. Abstract Idea:** The device's primary function is to predict cardiac arrhythmias, which is a medical diagnosis. Abstract ideas are not eligible for patent protection under 35 U.S.C. 101. However, the use of a specific technology, such as on-device neural networks, to achieve this function may be eligible.
- 2. Machine or Transformation:** The device is a tangible machine (wearable device) that performs a transformation (predicting cardiac arrhythmias) using a specific technology (on-device neural networks). This combination of machine and transformation may be sufficient to meet the eligibility requirements.
- 3. Significant Human-Computer Interaction:** The device is designed to interact with the user (the wearer) in real-time, providing predictions and alerts. This interaction is a significant aspect of the invention and may help to establish eligibility.

Based on these factors, it appears that the edge-computing wearable device that uses on-device neural networks to predict cardiac arrhythmias in real time may be eligible for patent protection under 35 U.S.C. 101.

Novelty Evaluation under 35 U.S.C. 102

To evaluate novelty, we will consider the following factors:

- 1. Prior Art:** The device's functionality is similar to existing wearable devices that monitor cardiac activity. However, the use of on-device neural networks to predict cardiac arrhythmias in real time may be a novel aspect of the invention.
- 2. Obviousness:** The combination of existing technologies (wearable devices, neural networks, and cardiac monitoring) may be considered obvious by a person of ordinary skill in the art. However, the specific implementation and integration of these technologies in the device may be novel and non-obvious.
- 3. Disclosure:** The device's functionality and technical specifications must be disclosed in sufficient detail to enable a person of ordinary skill in the art to practice the invention.

Based on these factors, it appears that the edge-computing wearable device that uses on-device neural networks to predict cardiac arrhythmias in real time may be novel under 35 U.S.C. 102, particularly if the disclosure is sufficient to enable a person of ordinary skill in the art to practice the invention.

Drafting Considerations

When drafting the patent application, consider the following:

- 1. Background of the Invention:** Provide a detailed description of the prior art and the need for a wearable device that can predict cardiac arrhythmias in real time.
- 2. Summary of the Invention:** Clearly describe the device's functionality, technical specifications, and how it achieves the desired result.
- 3. Detailed Description:** Provide a detailed description of the device's hardware and software components, including the on-device neural networks and their implementation.
- 4. Claims:** Draft claims that clearly and concisely describe the device's functionality and technical specifications,

PROMPT 3: FREEDOM-TO-OPERATE CLEARANCE (GENERATIVE AI LEGAL SAAS)

Engine: meta/llama-3.2-11b-vision-instruct •
Latency: 25008ms

USER PROMPT:

Provide a structured 3-step Freedom-to-Operate (FTO) clearance methodology for a SaaS company integrating generative AI models into enterprise legal contract review.

ACTUAL SALLY RESPONSE:

Freedom-to-Operate (FTO) Clearance Methodology for SaaS Company Integrating Generative AI Models

Step 1: Identify Potential Infringing Technologies and Patents

1.1 Conduct a Preliminary Patent Search

Utilize publicly available patent databases, such as the United States Patent and Trademark Office (USPTO) database, to search for patents related to:

Generative AI models

Natural Language Processing (NLP)

Machine Learning (ML)

Enterprise legal contract review

Similar technologies and applications

Use relevant keywords, such as "generative AI," "contract review," "NLP," and "ML," to identify potential patents

1.2 Identify Potential Infringing Technologies and Patents

Based on the preliminary search results, identify patents that may be relevant to the SaaS company's technology and business operations

Consider factors such as:

Patent scope and claims

Patent owner and licensing status

Patent expiration dates

Potential infringement risks

1.3 Document and Prioritize Potential Infringing Technologies and Patents

Create a comprehensive list of potential infringing technologies and patents, including:

Patent numbers and titles

Patent owners and licensing status

Potential infringement risks and mitigation strategies

Prioritize the list based on factors such as:

Patent scope and claims

Patent owner and licensing status

Potential infringement risks and mitigation strategies

Step 2: Conduct a Detailed Freedom-to-Operate Analysis

2.1 Conduct a Detailed Patent Search

Conduct a more in-depth search of patent databases, including:

USPTO

PROMPT 4: OFFICE ACTION SECTION 103 OBVIOUSNESS DEFENSE

Engine: meta/llama-3.2-11b-vision-instruct •
Latency: 25012ms

USER PROMPT:

Draft a concise, rigorous responsive argument to overcome a 35 U.S.C. 103 obviousness rejection by demonstrating lack of motivation to combine Reference A (solar power inverter) with Reference B (submersible fluid cooling pump).

ACTUAL SALLY RESPONSE:

Responsive Argument to Overcome 35 U.S.C. 103 Obviousness Rejection

Background

The Examiner has rejected the instant application under 35 U.S.C. 103, finding the claimed invention obvious over the combination of Reference A (Solar Power Inverter) and Reference B (Submersible Fluid Cooling Pump). However, the Applicant respectfully argues that the combination of these references is not motivated by the prior art, and thus, the claimed invention is not obvious.

Lack of Motivation to Combine

The combination of Reference A and Reference B is not motivated by the prior art for several reasons:

Different Technical Fields: Reference A is a solar power inverter, which is a device that converts DC power from solar panels to AC power for grid connection. In contrast, Reference B is a submersible fluid cooling pump, which is a device used to cool electronic equipment in harsh environments. The technical fields of these references are distinct, and there is no known problem or motivation in the prior art that would suggest combining these two devices.

No Known Problem or Need: There is no known problem or need in the prior art that would suggest combining a solar power inverter with a submersible fluid cooling pump. The Applicant's invention addresses a specific need for a reliable and efficient cooling system for solar power inverters in harsh environments, but this need is not addressed by the prior art.

No Teaching or Suggestion: Neither Reference A nor Reference B teaches or suggests combining the two devices. In fact, the references are designed to operate independently, and there is no known teaching or suggestion in the prior art that would suggest combining them.

Conclusion

In conclusion, the combination of Reference A and Reference B is not motivated by the prior art, and the claimed invention is not obvious. The Applicant respectfully requests that the Examiner reconsider the rejection and allow the instant application.

Drafted Claims

The following claims are drafted to overcome the 35 U.S.C. 103 obviousness rejection:

Claim 1: A solar power inverter system, comprising:

A solar power inverter for converting DC power from solar panels to AC power for grid connection

A submersible fluid cooling pump for cooling the solar power inverter

A control system for controlling the operation of the submersible fluid cooling pump

Claim 2: The solar power inverter system of claim 1, wherein the submersible fluid cooling pump is designed to operate in harsh environments.

Claim 3: The solar power inverter system of claim 1, wherein the control system is designed to optimize the operation of the submersible fluid cooling pump.

Patentability Analysis

The patentability analysis for the drafted claims is as follows:

Novelty: The drafted claims are novel over the prior art, as there is no known prior art that discloses a solar power inverter system with a submersible fluid cooling pump.

Non-Obviousness: The drafted claims are non-obvious over the prior art, as there is no known motivation in the prior art to combine a solar power inverter with a submersible fluid cooling pump.

Enablement: The drafted claims are enabled, as the prior art provides sufficient guidance for a person of ordinary skill in the art to practice the invention.

Specification

The specification for the drafted claims is as follows:

Background of the Invention: The background of the invention describes the need for a reliable and efficient

PROMPT 5: PRIOR ART SEARCH & INVALIDATION STRATEGY (ENCRYPTED BIOMETRIC WEBRTC)

Engine: meta/llama-3.2-11b-vision-instruct •
Latency: 25003ms

USER PROMPT:

Formulate an exhaustive prior art search strategy targeting an enterprise patent covering real-time biometric identity verification over encrypted WebRTC channels.

ACTUAL SALLY RESPONSE:

Prior Art Search Strategy for Enterprise Patent: Real-time Biometric Identity Verification over Encrypted WebRTC Channels

Objective

Conduct an exhaustive prior art search to identify existing patents, publications, and other relevant documents that may anticipate or render obvious the claimed invention of real-time biometric identity verification over encrypted WebRTC channels.

Search Scope

Patent databases:

United States Patent and Trademark Office (USPTO) database
European Patent Office (EPO) database
World Intellectual Property Organization (WIPO) database
PatentScope database

Non-patent literature (NPL) databases:

Google Scholar
ResearchGate
Academia.edu
arXiv
IEEE Xplore
ScienceDirect
SpringerLink

Open-source repositories:

GitHub
GitLab
Bitbucket

Industry reports and publications:

Gartner reports
Forrester reports
ABI Research reports
Industry conferences and workshop proceedings

Standardization organizations:

WebRTC standardization efforts (e.g., W3C, IETF)
Biometric standardization efforts (e.g., ISO, NIST)

Search Terms and Keywords

Biometric identity verification:

Biometric authentication
Biometric identification
Facial recognition

Fingerprint recognition

Iris recognition

Voice recognition

Real-time verification:

Real-time authentication

Real-time identification

Live biometric verification

Encrypted WebRTC channels:

WebRTC encryption

Secure WebRTC channels

End-to-end encryption

Transport Layer Security (TLS)

Secure Real-time Transport Protocol (SRTP)

Enterprise applications:

Enterprise identity verification

Enterprise biometric authentication

Secure enterprise communication

Real-time enterprise verification

Search Strategy

- 1. Initial search:** Conduct a broad search using the search terms and keywords listed above to identify relevant patents, publications, and other documents.
- 2. Refine search:** Refine the search by applying filters, such as date, country, and classification, to narrow down the results.
- 3. Analyze search results:** Analyze the search results to identify relevant documents that may anticipate or render obvious the claimed invention.
- 4. Citation analysis:** Conduct a citation analysis to identify documents that have been cited by the relevant documents identified in the search.
- 5. Forward citation analysis:** Conduct a forward citation analysis to identify documents that have cited the relevant documents identified in the search.
- 6. Patent family analysis:** Conduct a patent family analysis to identify related patents and applications that may be relevant to the search.
- 7. Non-patent literature analysis:** Conduct an analysis of non-patent literature to identify relevant publications, reports, and other documents that may be relevant to the search.

Tools and Resources

Timeline

Week 1-2: Conduct initial search and refine search using filters.

Week 3-4: Analyze search results, conduct citation analysis, and forward citation analysis.

Week 5-6: Conduct patent family analysis and non-patent literature analysis.

Week 7-8: Compile and review search results, and prepare report.
